

Wifi Internet Access Connection Procedure WINDOWS 2000

The library has provided wireless network service to connect your personal laptop to the World Wide Web while at your public library. All you need is a laptop, wireless adapter and web browser. There are three steps that you will need to follow in order to connect your wireless device to the library's wireless network.

Please be aware that this is not a secure network. It may be possible for personal data to be lost, damaged, or stolen while connected to the wireless network. Please refer to the library's Internet Use Policy.

NOTE: You will not be able to connect to a VPN server at this time. This capability should be available soon.

STEP 1: Set up DHCP

* If you know that your computer is setup to automatically obtain an IP address, you may skip to step 2.

1. Select **Start**
2. Select **Settings**
3. Select **Network and Dial-up Connections**
4. Network and Dial-up Connections box will appear
5. Select the **Local Area Connections** Icon
6. Local Area Connection Status box will appear
7. Click on **Properties**
8. Local Area Connections Properties box will appear
9. Highlight **Internet Protocol (TCP/IP)**
10. Click on **Properties**
11. The Internet Protocol (TCP/IP) Properties box will appear
12. Click on **Obtain an IP address automatically**
13. Click on **Obtain DNS server address automatically**
14. Close out all windows by clicking **OK**

Your computer is now configured for DHCP.

NOTE: If you have an Internet service that you often connect to that uses DHCP you will not have to set up this service, but your laptop may have retained that IP address in its files. To get a new IP address through DHCP you will need to release and renew the IP address.

To Release and Renew IP Addresses:

1. Go to a command prompt. In order to get a command prompt, click start and choose run. In the “**open:**” line, type “**cmd**”. A black box will open with a command prompt inside it.
2. At the command prompt, type: **Ipconfig /release** - You should get a notice that the address has been released.
3. Now you need to get a number from the library network. At the command prompt, type: **Ipconfig /renew** - After a brief time, you should be notified that you have a new IP address associated with your NIC card. Once you have received a library IP address, proceed to the browser configuration instructions.

* You must have administrative rights to your computer in order to release or renew your IP address.

STEP 2: Setup wireless client

* If you client auto detects the library wireless network, you may skip to step 3.

Library should provide settings for connecting wireless clients to the access points.

STEP 3: Setup browser proxy settings in Internet Explorer

1. Open Internet Explorer
2. On the IE menu bar, click **Tools**, then **Internet Options**
3. Under the Internet Option dialog box, click the **Connections** tab and then the **LAN Settings** button.
4. In the **LAN Settings** dialog box, click “Use a proxy server for your LAN”
5. Enter **10.50.0.20** in the **Address:** field and **8080** into the **Port:** field (You may need to uncheck the Use automatic configuration script box)
6. Click OK twice.

NOTE: If you have installed a Personal Firewall System (PFS) you need to be sure that your PFS is not blocking Internet Access. You may need to authorize access while you are using the connection. Please refer to your vendor’s documentation for instructions on how to do this.
